Are you employing the latest and best practices that support improved care for children?

We all want to give children our best. For designers, architects and healthcare providers, "our best" means providing care environments that help them get better, faster, and make the experience a lot less scary.

Today, new pediatric-specific, evidence-based design strategies – that integrate architecture, design and technology with innovative medical practice – are improving care, outcomes and the experience for infants to adolescents. Their families and clinical caregivers benefit, too.

Hear a nationally acclaimed faculty of health facility design experts and providers share the latest pediatric facility design trends, research and case studies – in a collaborative, interactive, problem-solving workshop – that can inform and enable project stakeholders in their mission to improve care for children.

What You’ll Learn

• The latest trends in pediatric care and how the built environment enables that care
• The role of positive distractions in the care process and design’s impact on creating those distractions
• Demographic considerations in designing children’s healthcare spaces for culturally diverse populations
• How to apply best practices from case studies of state-of-the-art facilities to pediatric healthcare settings.
